Tandem Business AI by OpenDL

An AI front desk and back office for small businesses

Seven AI agents help the team. People stay in control of everything that matters.

Built on Vultr · Agent Rush, Challenge 2: Future of Work

Live demo: tandemai.open-dl.com · Clinic website: tandemaidentaldemo.open-dl.com · Synthetic data only

THE PROBLEM

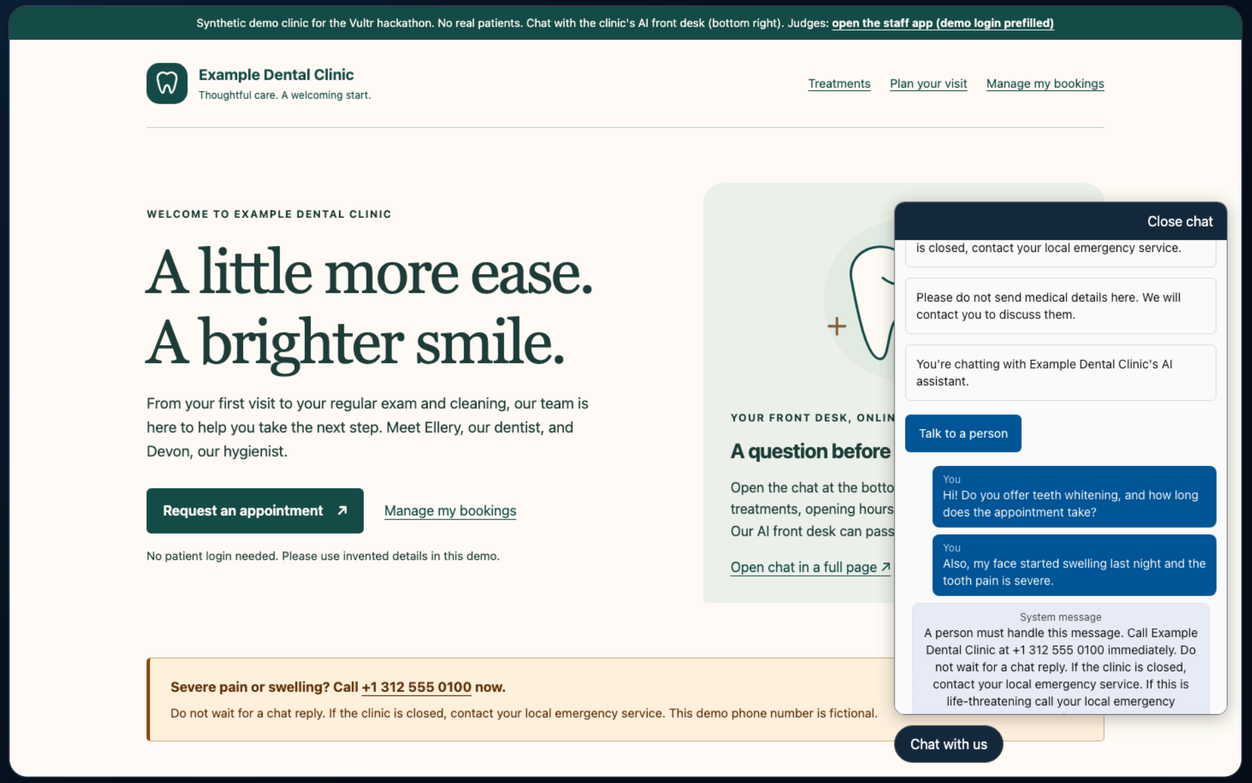

Small teams drown in small tasks

- Customer questions arrive at all hours, in chat and email, and each one needs the business's own facts.
- Bookings, stock, suppliers, invoices and follow-ups live in different tools, so tasks slip.
- Most AI tools either only chat, or act without asking. Owners need help they can **trust and control**.
- Some businesses, such as clinics, also need emergencies handled by a person, every time.

CUSTOMERS

Service on the business's own website

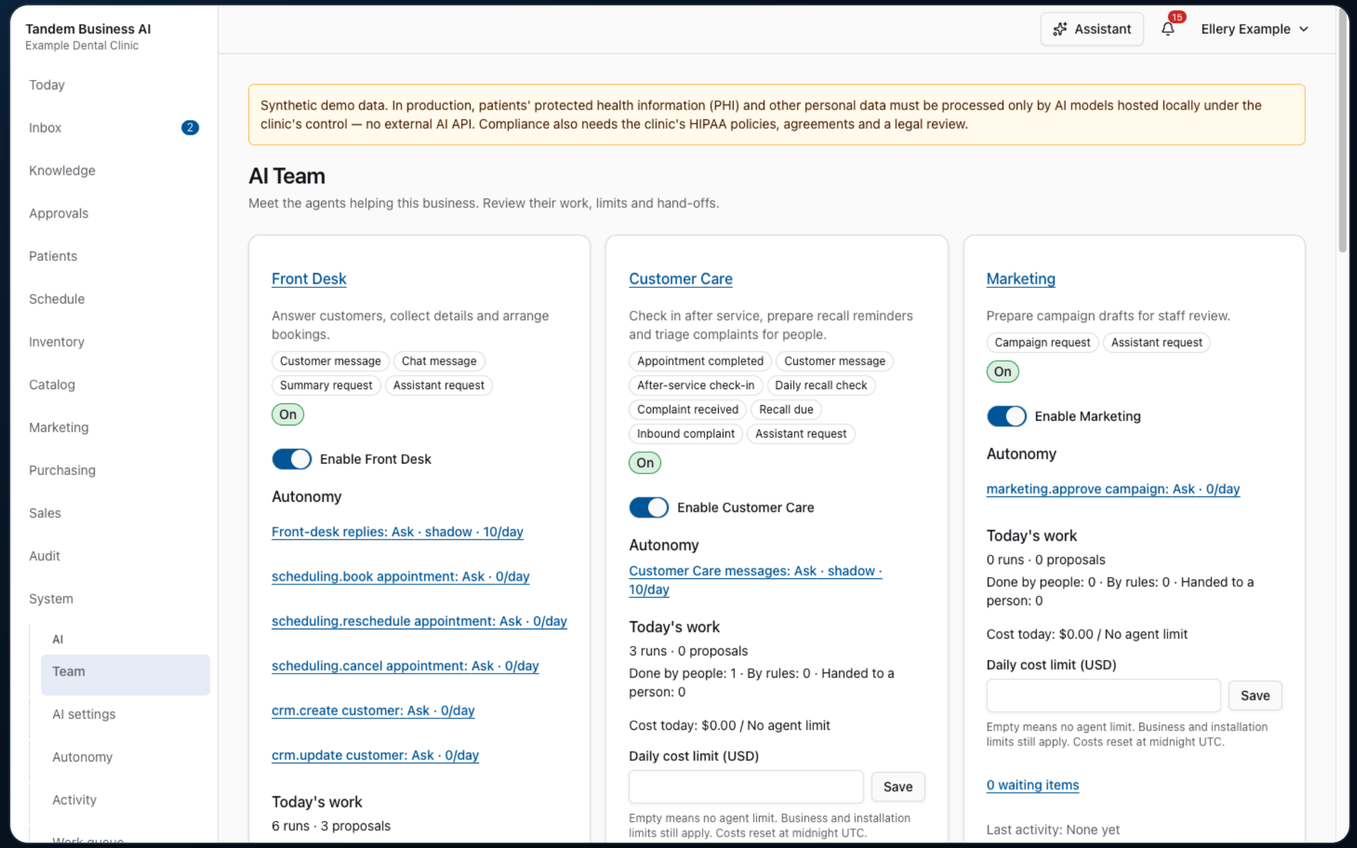

- Chat embedded with one line of code, only on websites the owner allows.
- **Emergencies go to a person** before any AI runs, with the phone number at once.
- Routine answers from the business's knowledge, with citations; the owner decides what may go out automatically.
- Appointment requests and **self-service rescheduling** by emailed link, no account.

THE AI TEAM

Seven agents, each with a job and limits

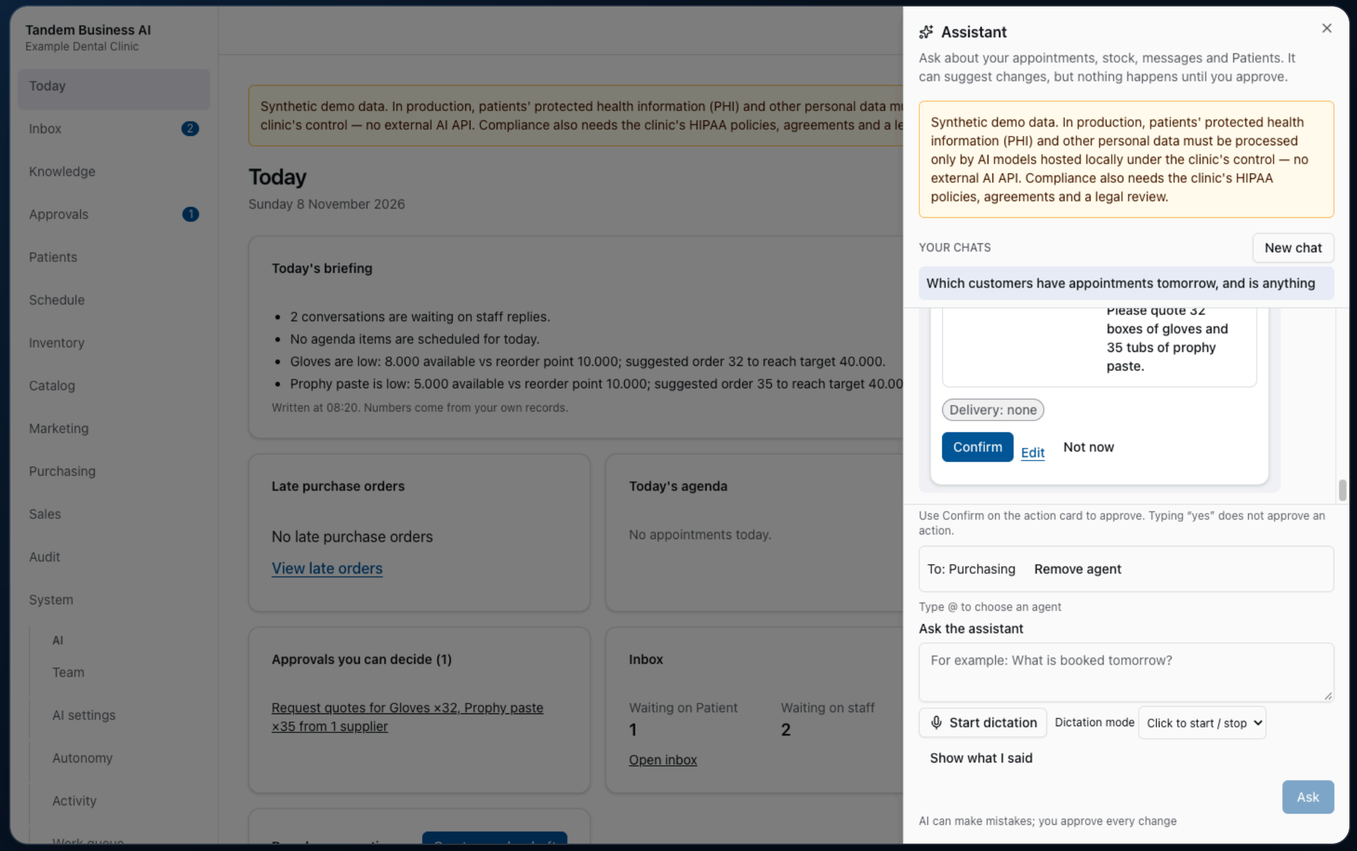

- **Front Desk**: answers, summaries, booking requests
- **Customer Care**: check-ins, recalls, complaints
- **Marketing**: campaign drafts, consent first
- **Inventory**: reorder suggestions
- **Purchasing**: quote requests, comparisons, POs
- **Finance**: overdue-invoice reminders
- **Operations Manager**: briefing and hand-offs

STAFF

Ask in words or by voice

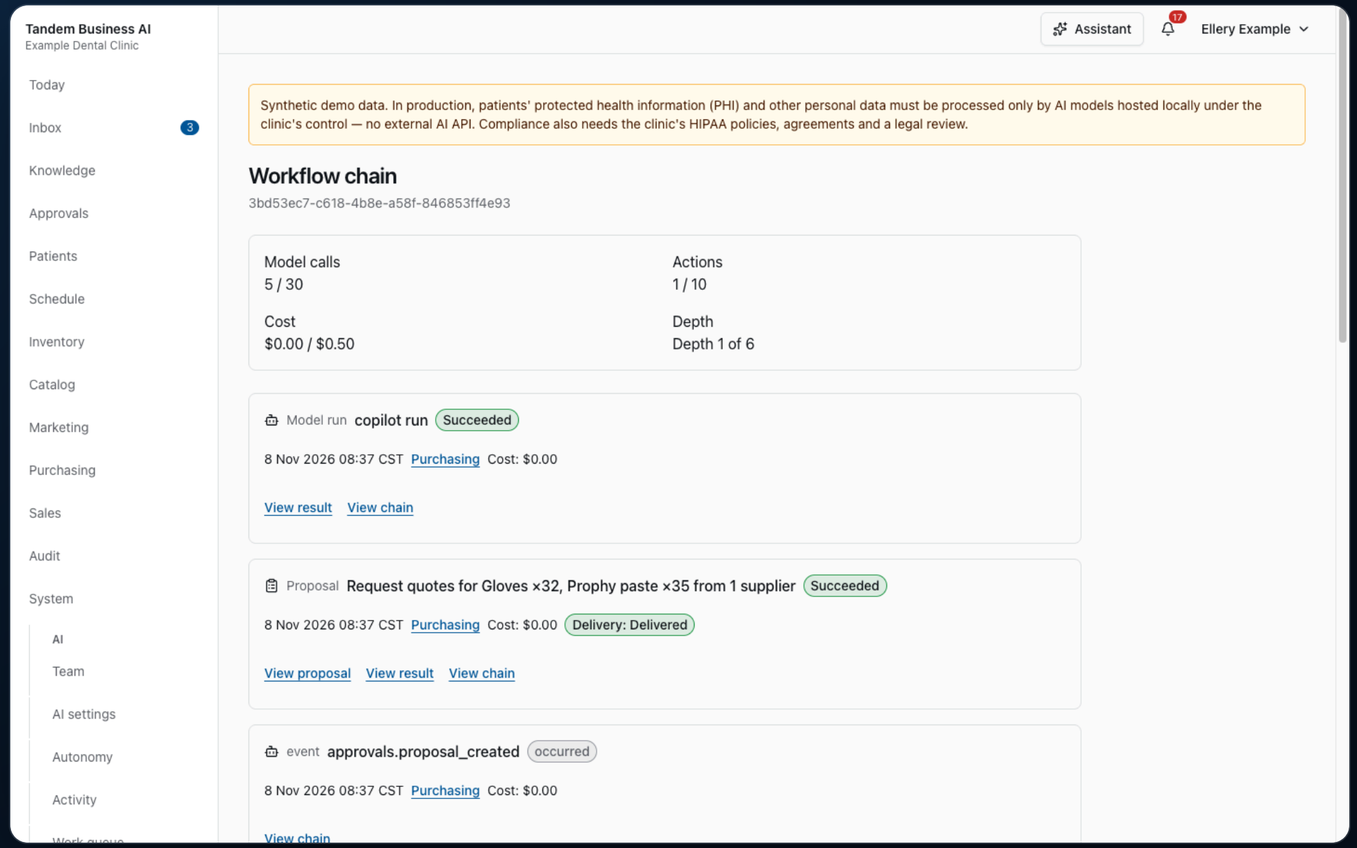

- The assistant answers from live records: stock, reorder points, supplier prices, schedule.
- Voice dictation transcribed by **Whisper on Vultr**.
- "@Purchasing get quotes…" hands the job to an agent, which drafts a proposal for one click.
- AI-sent messages wait in a stop window.

SAFETY

People stay in control

- Agents **propose**; staff approve with evidence. Nobody approves their own request.
- Owner's guardrail in plain words, checked before any automatic reply.
- Autonomy per action: off, ask, act and notify, act; shadow mode first.
- Every chain capped: 6 steps, 30 model calls, 10 actions, $0.50. Full audit log.
- Customer text is data, never instructions. Prices and rankings come from code.

ARCHITECTURE

Built on Vultr

Vultr Compute

One VM runs React, FastAPI, PostgreSQL (row-level security), worker, Keycloak and Caddy with Docker Compose.

Serverless Inference

Every model call through a routing gateway: mimo, DeepSeek and Qwen models with fallbacks; Qwen embeddings; Whisper speech-to-text.

Object Storage

Encrypted restic backups with a tested restore drill.

Container Registry

Versioned application images; upgrades with automatic rollback on a failed smoke test.

Terraform

The vultr/vultr provider provisions the VM, firewall, storage and registry; one install script.

Customer-owned

Each business runs its own copy on its own Vultr account. A regulated profile allows only private models.

MEASURED

Evaluated on live Vultr models

Reply guardrail (two runs)	**16/16**	Prompt injection	**15/15**
Grounding	**10/10**	Retrieval	**8/8**
Intake	**76/78**	Customer Care	**18/19**
Backend tests (96% coverage)	**2,400+**	Frontend tests	**580+**
Demo VM load test, 20 staff	**204 ms p95**	Whole public demo so far	**≈ $10**

Synthetic cases, not guarantees. Reports and dated logs are in the repository.

BUSINESS MODEL

Customer-owned, low running cost

- The business owns its install and data on its own Vultr account and pays Vultr directly for compute and inference.
- OpenDL offers setup and a support subscription. **Prices to be confirmed.**
- Per-business AI budgets and daily cost limits keep inference spend predictable.
- Fits service businesses first: repair shops, clinics, garden centres and other appointment-based work.

HONEST SCOPE AND NEXT STEPS

What was built when

- The non-AI ERP was built before kickoff and disclosed. **All AI was built during the event** (3–8 Nov 2026), with dated logs.
- The demo uses synthetic data and simulated email. Not a compliance certification for real patient data.
- Next: real email delivery, host-level egress filtering, local models for regulated clinics, more agent evaluations.
